#### Overview

- Introduction
- 2 Data
- Model
  - First Stage
  - Second Stage
- Preliminary Results

## Drought

- In April 2016 in the United States:
  - 14% of land was in drought and 34% was abnormally dry.
  - 84.3 million people live in drought-affected areas, and 17.5 million live in areas experiencing exceptional drought
- In California:
  - 90% of the state is in drought and more than 50% is in severe to exceptional drought.

## Drought, April 19, 2016

## Drought

- Climate change is likely to increase the length and severity
- Resilience, not just risk of drought, will have far reaching implications for welfare changes from climate change.

# What makes some communities more or less vulnerable to drought?

- Welfare impacts not purely determined by severity and duration of drought
- We use sensitivity analysis to try to identify some of the salient channels
- Two stage analysis:
  - Stage 1: Estimate "vulnerability" = correlation between drought and 'welfare';
  - Stage 2: Identify predictors of vulnerability
- Unpacking predictors would have important policy implications

DS421 (UC Berkeley) Drought Resiliency April 27, 2016 6 / 15

## Stage 1 Data: 2005-2014

#### Left Hand Side

- Mortality:
  - Annual CDC WONDER database
  - Over-65 and all-ages
- Yields:
  - Annual USDA crop yield
  - Corn, soybeans, and wheat
- Employment:
  - United States Bureau of Labor Statistics
  - Unemployment Rate

#### Right Hand Side

- US Drought Monitor:
  - Scale from 0-4 updated weekly
  - We create a 1-year, 3-year, and 5-year measure

## Stage 2 Data

#### Left Hand Side

ullet  $\hat{eta}$  from the first stage.

#### Right Hand Side

- American Community Survey:
  - Annual (2005-2014) survey conducted by US Census
  - Over 65, Under 5, Race, Ethnicity, Sex, Work in farming or ranching, Household Income, Household water bills
- Water Usage:
  - EPA Facility Registry Service
  - Count of facilities from high water use industries (agriculture, manufacturing and energy) per county

#### First Stage Equation

$$y_{i,t} = \beta_i D_{i,t} + \alpha_i + \tau_i t + \gamma_{s,t} + \epsilon_{i,t}$$
 (1)

#### Where:

- $D_{i,t}$  refers to the number of days in U.S. Drought Survey bins 2-4 in county i and year t
- $\alpha_i$  are county fixed effects controlling for time-invariant differences between counties
- $\bullet$   $\tau_i$  is the coefficient on a county level linear time trend
- $\gamma_{s,t}$  are state-by-year fixed effects controlling for state level time trends common across all counties  $i \in s$

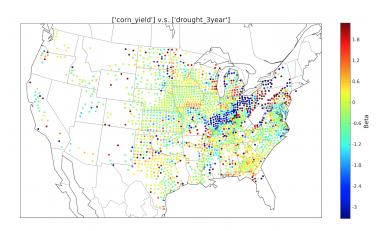

#### **Second Stage Equation**

$$\beta_i = \rho_0 + \delta \mathbf{X}_i + \nu_i \tag{2}$$

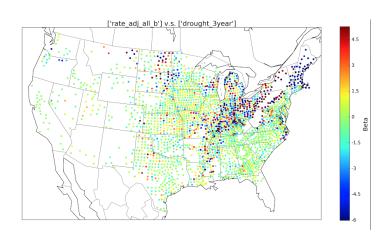

#### Where:

- $\beta_i$  come from Eq.(1) for a given outcome
- X<sub>i</sub> represents a vector of county characteristics such as urban/rural, proportion below age 5 or above age 65, home ownership, median cost of residential water bill
- $oldsymbol{\delta}$  is a vector of the associated coefficients

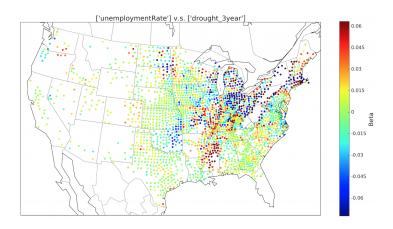

## $\beta$ of 3-yr Drought on Corn Yield

## $\beta$ of 3-yr Drought on Mortality

## $\beta$ of 3-yr Drought on Unemployment
